Automated Discovery, Classification & Remediation Platform

- Seamlessly enforce sensitive data. Consistent classification makes sensitive data protection uniform.

- Dynamically protect data. Classify data automatically to protect it from the moment it exists

- Lower costs. Intuitive, easy-to-use features and predefined policies help minimize the resources devoted to classification.

- Assist compliance. Classify and protect files required by governing bodies.Protect corporate reputation.

- Automatically search both structured and unstructured data.

In current systems, data is filed and forgotten across multiple enviornments, from databases to Dropbox, from SQL to Sharepoint or from CIFS to Images.

Finding information in both structured and unstructured enviornments is a key pillar of any Data Classification project. The ability to search for Personally Identifiable Data is crucial to any organisation's GDPR programme. Once found you can begin to classify and then remediate your data and policies.

Classification can be a daunting undertaking. Trying to change user behaviour, dealing with an overwhelming number of files and attempting to answer questions about legacy data, ownership, and compliance can tempt even seasoned veterans to postpone this project indefinitely. However, effective classification allows an organization to determine whether data needs to be retained, where it should be stored, who should have access to it, and what controls must be in place to protect it.

Northdoor's DDC solution revolutionizes this process through automation built upon its unparalleled discovery accuracy. An extensive, automated classification coupled with discovery and monitoring platform dramatically reduces the cumbersome effort required for existing, manual classification programs. With a few clicks, you can create rules to classify locations based on their content, location, and other metadata to enhance your data visibility, send notifications, and manage workflows, thereby prioritizing the importance of your data.

Easy-to-use, wizard-driven user interface helps you drive classification forward quickly using the rules and policies of your business by providing your own definitions, keywords, or data dictionaries or by using any of the popular templated solutions including those for PCI, PHI, PII, Social Security Numbers, ITAR and other sensitive data types. You can deploy these policies to your users easily, including custom policies for across the organization or within specific business units.

With a structured, automated classification, you can promote a safe data culture in your organization that helps protect the business and minimizes risk without hindering the work that needs to be done.
